

▼ Review

```
import random
```

<https://docs.python.org/3/library/random.html>

```
random.randint(a, b)
```

Return a random integer N such that $a \leq N \leq b$.

```
dice1 = random.randint(1, 6)
print(dice1)
```

4

```
dice2 = random.randint(1, 10)
print(dice2)
```

8

```
total = dice1 + dice2
print(total)
```

12

```
dice1 = random.randint(1, 6)
```

Saved successfully!

```
# tell me your guess.
```

```
# what are the possible numbers in guess..
```

```
print(guess)
```

4

```
import random
```

```
dice1 = random.randint(1, 6)
```

```
dice2 = random.randint(1, 6)
```

```
guess = (dice1 * dice2)
```

```
print(guess)
```

```
# tell me your guess?
```

```
# what are the possible numbers in guess..
```

12

```
for i in range(50):
    dice1 = random.randint(1, 6)
    dice2 = random.randint(1, 6)
    guess = (dice1 * dice2)
    # tell me your guess?
    # what are the possible numbers in guess..
    print(guess)
```

▼ List

We all have made our micro:bit step counter... So we will have our step records: i.e. 6000 steps, for Monday, 5432 steps on Tuesday...

How can we store them as we may add them together?

```
step_count_records = [] # this is an empty list.
```

```
step_count_records.append(6000)  
print(step_count_records)
```

```
[6000]
```

```
step_count_records.append(5432)  
print(step_count_records)
```

```
[6000, 5432]
```

```
step_count_records.append(8790)  
print(step_count_records)
```

Saved successfully!

This is a bit of boring... we have seven days in a week, 30 days in a month!!

```
# this is a list of string, and we can create a new list like this:  
list_of_days = ["Mon", "Tue", "Wed", "Thu", "Fri", "Sat", "Sun"]  
print(list_of_days)
```

```
['Mon', 'Tue', 'Wed', 'Thu', 'Fri', 'Sat', 'Sun']
```

```
# btw, an element of a list can be got by its ID like this:  
print(list_of_days[4])
```

```
Fri
```

▼ Wait, Something wrong with the ID!!

Always remember: list ID starts with **0**!!

and ...

ends with ???

▼ Let's see how "loop" can help us

```
for day in list_of_days:  
    print(day)
```

```
Mon  
Tue  
Wed  
Thu  
Fri  
Sat  
Sun
```

We need some fake data, LoL...

```
import random
```

```
min_steps = 4000  
max_steps = 12000  
fake_record = random.randint(min_steps, max_steps)
```

Saved successfully!

```
for day in list_of_days:  
    fake_record = random.randint(min_steps, max_steps)  
    print(day, ": ", fake_record)
```

```
Mon : 6146  
Tue : 6916  
Wed : 11249  
Thu : 11608  
Fri : 6993  
Sat : 4882  
Sun : 11213
```

we will put the fake record in to a list now:

```
step count records = []
```

```

for day in list_of_days:
    fake_record = random.randint(min_steps, max_steps)
    step_count_records.append(fake_record)
    print(day, ": ", fake_record)

```

```

Mon : 11846
Tue : 8015
Wed : 7031
Thu : 5174
Fri : 11794
Sat : 9631
Sun : 8790

```

```
print(step_count_records)
```

```
[11846, 8015, 7031, 5174, 11794, 9631, 8790]
```

Question, how to add them together? We want to see who did the most steps in a week!!

We will use what we learned last week, adding thing together.

```
total_steps = 0
```

```

for record in step_count_records:
    total_steps += record

```

```
print(total_steps)
```

Saved successfully!

Could you tell me who got the most steps in a week?
